Title:

283416 seqs, 96216763 residues Searched: 283416 Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 2000000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

pirl: pir2:\* pir3:\* PIR 79:\* 1 2 K 4 Database

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

enome polyprotein - hepatitis C virus (strain JT)

1/Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98)

protein NS4a; nonstructural protein NS4b; nonstructural protein NS5

1/S. Species: hepatitis C virus

1/S. Species: hepatitis C virus

1/Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 09-Jul-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 VPHPNIEEVALSNTGEIPFYGKAIPIEAIKGGRHLIFCHSKKKCDELAAKLTGLGLNAVA

A;Note: this sequence is inconsistent with the nucleotide translation
A;Note: the authors translated the codon AGG for residue 43 as Pro, TGG for residue 320
as Trp, and TTC for residue 771 as Ser
A;Note: sequence extracted from NGBI backbone (NCBIN:121747, NCBIP:121748)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       genome polyprotein - hepatitis C virus (isolate EUH1480)
N;Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstruct
protein NS4a; nonstructural protein NS4b; nonstructural protein NS5
C;Species: hepatitis C virus
C;Date: 19-May-2000 #sequence_revision 19-May-2000 #text_change 09-Jul-2004
C;Accession: JC5620

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PUZDEPLIGE - hepatitis C virus (type 5a) (fragments)

N;Contains: core protein; E1 (carboxyl end); E2/NS1 (amino end); NS3 protein; NS4A prote C;Species: hepatitis C virus (type 5a) (fragments)

C;Species: hepatitis C virus

C;Species: hepatitis C virus

C;Accession: PC2219

R;Stuyver, Li, Arnhem, W.V.; Wyseur, A.; Maertens, G.

Biochem. Biophys. Res. Commun. 202, 1308-1314, 1994

A;Title: Cloning and phylogenetic analysis of the core, E2, and NS3/NS4 regions of the A;Reference number: PC2219; MUID:94338342; PMID:7520237

A;Accession: PC2219

A;Molecule type: mRNA

A;Reference number: PC2219; MUID:94338342; PMID:7520237

A;Accession: PC2219

A;Molecule type: mRNA

A;Reference serum

C;Superiamily: hepatitis C virus genome polyprotein

C;Superiamily: hepatitis Predicted <NSR>

F;191-70/Product: B2/NSI (amino end)

F;12-783/Product: NS3 #status predicted <NSR>

-I-FUNCTION: The small proteins NS2A, NS2B, NS4A and NS4B are hydrophobic, suggesting a possible membrane-related function. NS3 and NS5 may play a role in the viral RNA replication.

-I-CATALVITI ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

-I-CATALVITIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              {RNA}(N).
SUBUNIT: The virion of this virus is a nucleocapsid covered by a lipoprotein envelope. The envelope consists of two proteins: protein M and glycoprotein E. The nucleocapsid is a complex of protein C and mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hepatitis C virus (isolate Japanese) (HCV).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (RNA)(N).
SUBUNIT: The virion of this virus is a nucleocapsid covered by lipoprotein envelope. The envelope consists of two proteins: protein M and glycoprotein E. The nucleocapsid is a complex of protein C and mRNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequences given in AAR25854-74 are hepatitis C virus protiens. The genes encoding these proteins can each be used to prepare recombinant vectors by ligating the gene of interest in to a vector to be expressed in E. coli. These polypeptides are useful as diagnostic reagents for type C hepatitis and they may be produced efficiently by recombinant methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hepatitis C virus antigen expressed as recombinant in E.coli - useful for diagnosis of hepatitis C virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       50 VPHPNIEEVALSNIGEIPFYGKAIPIEAIKGGRHLIPCHSKKKCDELAAKLTGLGLNAVA 109

Neutralized antibody partial peptide derived from hepatitis C virus - useful for inhibiting Hepatitis C Virus (HCV) serine protease activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the amino acid sequence of a Ser/Thr protease from hepatitis C virus. The invention relates to the use of partial peptides (AAY14348-Y14353) from the anti-HCV neutralising MAb 8D4 for inhibiting HCV serine protease activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 VPHPNIEEVALSNTGEIPFYGKAIPIEAIKGGRHLIFCHSKKKCDELAAKLTGLGLNAVA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the NS3 region of the hepatitis C virus (HCV) serine protease. The fragment of this sequence represented in AAW26159 is recognised by the monoclonal antibody of the invention. The monoclonal antibody belongs to the IgG class of antibodies. The antibody is produced by fusion cells formed between immunocytes from a HCV infected mammal, and myeloma cells from the same mammal. The antibody is used for diagnosis of HCV infection. As this monoclonal antibody can bind to a certain chain in serine protease and inhibits the enzyme specifically, it can also be used as an agent for neutralising the activity of serine
The sequences given in AAR25876-95 are encoded by the claimed hepatitis C virus genes of the invention which have been inserted into an E. coli vector. These polypeptides are useful as diagnostic reagents for type C hepatitis and they may be produced efficiently by recombinant DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Serine protease; NS3 region; HCV; hepatitis C virus; monoclonal antibody; 1gG; immunocyte; myeloma cell; inhibitor; neutralising agent.

The present invention describes a chimeric protein comprising at least one signal protein that has a trafficking signal targeting to a subcellular organielle and at least one proteolytic cleavage site for a proteolytic standard and at least one proteolytic cleavage site for a proteolytic site or a signal masking protein through the proteolytic site or a signal masking protein through the proteolytic site or a signal masking protein through the proteolytic site or a signal masking protein through the proteolytic site or a signal protein spresent in cytosol; (b) the trafficking signal of at least one signal protein is activated when the proteolytic cleavage site is cleaved to signal protein as a result at least one fragment protein that includes the activated signal protein is labelled with at least one cludes the activated signal protein is labelled with at least one fluorescent protein and the position and intensity distribution of the fluorescent label signal in the cell is altered depending on the cleavage by the protease. Also described: (1) a recombinant gene comprising a nucleic acid sequence encoding the chimeric protein which is constructed to express the chimeric protein in a cell; (2) a cell transformed with the recombinant gene or vector; (3) analysing the activity of a protease inside a cell; (6) a nucleic acid comprising the chimeric protein for detecting protease activity in a cell; (7) a vector comprising the nucleic acid; (8) a kit for detecting a protease inside a cell; (6) a nucleic acid; (8) a kit for detecting a protease inside a cell; (9) a recent or the vector; (1) or protease activity and (1) detecting a protease inside a cell; (1) a vector comprising the nucleic acid; (1) detecting a nucleic acid; (1) detecting a protease inside a cell; (2) a protease includes the chimeric protein for detecting protease includes a protease activity of a protease includes a protease activity of a protease activity and the chimeric protein for detecting protease activity and the chimeric protein in the cell
chimeric protein, useful for detecting protease inhibitors inside the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (9) detecting a protease inside a cell or tissue, and (10) detecting a protease inhibitor in vivo. The chimeric protein is useful for detecting protease inhibitors inside the cell or tissue. The present sequence represents HCV NS3 protease, which is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 VPHPNIEEVALSNTGEIPFYGKAIPIEAIKGGRHLIFCHSKKKCDELAAKLTGLGLNAVA

This protein from HCV (hepatitis C virus) (encoded by AAQ80498) is cleaved between amino acids 2419 and 2420, by a new serine protease, contg. the sequence of AAR68621. The proteinses is purified as a fused product with the dihydrofolate reductase protein by using a methotrexate column. It can be used for the development of an inhibitor for HCV proteinase. (Updated on 16-OCT-2003 to standardise OS field)
     The present sequence (contg. AAR82693) is that of a partial proteinase isolated from Hepatitis C virus (HCV). The proteinase can be used as an anti-HCV agent. It can also be used to screen cpds. for their ability to inhibit its proteolytic activity. In this way proteinase inhibitors can be identified. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New HCV-originated proteinase active substance - used for site-specific cleavage by an intermolecular reaction and the purification thereof.
                                                                                                                                                                                                                             1 VPHPNIEEVALSNTGEIPFYGKAIPIEAIKGGRHLIFCHSKKKCDELAAKLTGLGLNAVA

                                                                                                                                                                                                                                                                    The present sequence is that of a partial proteinase isolated from Hepatitis C virus (HCV). The proteinase can be used as an anti-HCV as It can also be used to screen cpds. for their ability to inhibit its proteclyric activity. In this way proteinase inhibitors can be identified.                                                                                                                                                                                                                                                                                                           AAQ81559 encodes AAR68864 hepatitis C virus (HCV) RNA helicase. The DNA was used in the construction of an expression vector, which was used to transform a baculovirus host. The transformed baculovirus could then be used for the recombinant prodn. of HCV RNA helicase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 VPHPNIEEVALSNTGEIPFYGKAIPIEAIKGGRHLIFCHSKKKCDELAAKLTGLGLNAVA

The novel method comprises amplifying the amino terminal region of a hepatitis-C virus NS3 gene using a predetermined primer and determining the hepatitis-C virus in a base sequence of the obtained DNA fragment. The novel testing method is useful for diagnosing liver cancer and also used in a gene amplification technique, a clinical laboratory test reagent, a polymerase chain reaction, a base sequence analysis and genetic engineering. The method enables the detection of a hepatitis-C virus having high carcinogenicity with high specificity. This sequence represents the protein of the hepatitis-C virus NS3 gene of the
                                                                                                                                                                      The present sequence is a partial Hepatitis C Virus (HCV) polyprotein from the non-structral region. Partial proteinase sequences (AAR82692-93) are contained within this sequence. The proteinases can be used as anti-HCV agents. They can also be used to screen cpds. for their ability to inhibit their proteolytic activity. In this way proteinase inhibitors can be identified. (Updated on 16-OCT-2003 to standardise OS field)
An HCV proteinase active substance - which has activity as an anti-HCV agent and can be used to screen for proteinase inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 VPHPNIEEVALSNTGEIPFYGKAIPIEAIKGGRHLIFCHSKKKCDELAAKLTGLGLNAVA

The peptide comprises amino acids 1471-1573 of the HCV polyprotein. The specification describes antigenic epitopes from HCV core protein, NS3 protein, NS4 protein and NS4 protein and NS4 protein and HCV in a biological sample. They are also useful for monitoring HCV in a patient sample in addition to diagnostic reagents for detecting HCV in a patient sample in addition to diagnosis. Pharmaceutical compositions comprising the peptides are useful for preventing, minimizing or reducing HCV infection in patients who have been exposed to HCV or to individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New (mosaic) polypeptides, useful as reagents in assays for the diagnosis or monitoring of HCV infections and as components of anti-HCV vaccines, comprises antigenic groups of hepatitis C virus (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      59

Sequence 268, Application US/08635886C

Patent No. 6555114

GENERAL INPORMATION:

APPLICANT: LEROUX-ROELS, Geert

APPLICANT: DELEYS, Robert

TITLE OF INVENTION: MARKTENS, Geert

TITLE OF INVENTION: VIRUS

FILE REFERENCE: 275-18

CURRENT APPLICATION NUMBER: US/08/635,886C

CURRENT FILING DATE: 1996-04-25

PRIOR APPLICATION NUMBER: EP 93402718.6

PRIOR FILING DATE: 1994-10-28

PRIOR FILING DATE: 1993-11-04

NUMBER OF SEQ ID NOS: 286

SOCTWARE PATENCATION NUMBER: EP 93402718.6

SOCTWARE PATENCATION NUMBER: DE 93402718.6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Seguence 268, Application US/08974690C

Sequence 268, Application US/08974690C

Patent No. 661333

GENERAL INFORMATION:

APPLICANT: LEROUX-ROELS, Geert

APPLICANT: DESCUINANT: MARTENS, Geert

TITLE OF INVENTION: UNRONOMINANT HUMAN T CELL EPITOPES OF HEPATITIS C

TITLE OF INVENTION: VIRUS

TITLE OF INVENTION: VIRUS

FILE REFERENCE: 2251-94

CURRENT APPLICATION NUMBER: US/08/974,690C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 VPHPNIEEVALSNTGEIPFYGKAIPIEAIKGGRHLIFCHSKKKCDELAAKLTGLGLNAVA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes an oligonuclectide sequence which potentiates the expression of a useful gene when incorporated in a gene expression vector, where the oligonuclectide sequence consists of the 5'-non-translated region (5'UTR) of a viral genome or its fragment or modified form. The 5'UTR sequence is useful in screening potential initiation factors of interaction with the viral IRES or IRES-dependency, for treatment of diseases caused by cap-dependent mRNA translation and in the diagnosis of the severity of HCV infection. The present sequence represent sequence from a Hepatitis type C virus (HCV) exemplification of the present invention
                                                                                            9

This is a recombinant protein 120NA. This recombinant protein contains
the Hepatitis C virus (HCV) core polypeptide 120 fused to a nucleic acid-
binding motif present in the HBC protein of Hepatitis B virus (HBV). This
recombinant protein can be bound to a nucleic acid in the host for
producing a nucleic acid-bound polypeptide by a new method. The method
comprises producing a fusion gene containing the polypeptide and the
nucleic acid-binding motif, binding a nucleic acid to the polypeptide as
a soluble fraction, and purifying the nucleic acid-bound polypeptide from
the soluble fraction. When the polypeptide caid-bound polypeptide from
cantigen, the nucleic acid-bound polypeptide is a recombinant form of an
antigen, the nucleic acid-bound polypeptide caid bound polypeptide caid-bound polypeptide can be used as an immunoassay
reagent for detecting the antigen or an antibody to the antigen,
especially in an agglutination assay using particles coated with the
nucleic acid-bound polypeptides can be applied to diagnosis
of disease and infection, especially for the detection of HBV and HCV
polypeptides. The nucleic acid-bound polypeptides may be immunoreactive
in cases where the free polypeptide is not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         6 MSTNPKPQRKTKRNTNRRPQDVKFPGGGQIVGGVYLLPRRGPRLGVRATRKTSERSQPRG 65

```
DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection.
                                                                                                                                                                                                                                                                                                                                 AAR92936-R92987 are HCV core proteins derived from 52 different HCV isolates. Isolated cDNA sequences are used for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequences given in AAR24525-27 are examples of a new structural gene of hepatitis C virus (HCV) encooded by various expression vectors. This polypeptide has HCV antigen activity and can be used to recognise anti-HCV antibodies existing in the serum of HCV patients specifically. It can be used as a diagnostic agent by the agglutination or ELISA method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAR24525-27 are examples of a new structural gene of hepatitis C virus (HCV) encooded by various expression vectors. This spolypetide has HCV antigen activity and can be used to recognise anti-HCV antibodies existing in the serum of HCV patients specifically. It can be used as a diagnostic agent by the agglutination or ELISA method
                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                   9
                                                                            compounds, which
                                                                         The present invention relates to a method for screening compounds, which interfers with the inhibition of the function of RecQ helicases by hepatitis C virus (HCV) proteins. The method can be used to identify compounds which can be used for the prevention and treatment of liver disorders associated with HCV infection, such as liver cancer. The present sequence was used in the present invention. (Updated on 06-AUG-2003 to correct OS field.)
          Screening method for substances interfering with the inhibition of WRN helicase by hepatitis C virus protein for use in preventing liver disorders such as cancer associated with hepatitis C infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New structural protein gene of hepatitis C virus - encodes specific sequence of 163 aminoacid(s), useful for the diagnosis of hepatitis C.

This is a nucleic acid-bound polypeptide 120NA120. This contains the Hepatitis C virus (HCV) core polypeptide 120 and a nucleic acid-binding motif present in the HBC protein of Hepatitis B virus (HBV). This nucleic acid-bound polypeptide can be produced by a new method. The method comprises producing a fusion gene containing the polypeptide and the nucleic acid-bound polypeptide as a soluble fraction. When the polypeptide is a recombinant form of an antigen, the nucleic acid-bound polypeptide from antigen, the nucleic acid-bound polypeptide is a recombinant form of an antigen, the nucleic acid-bound polypeptide can be used as an immunoassay reagent for detecting the antigen or an antibody to the antigen, the nucleic acid-bound polypeptide can be used as an immunoassay reagent for detecting the antigen or an antibody to the antigen.

C especially in an agglutination assay using particles coated with the nucleic acid-bound polypeptides. The methods can be applied to diagnosis of disease and infection, especially for the detection of HBV and HCV consequence of the properties of the properties of the methods and the muchoreactive consequence of the muchos of the methods of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The HCV envelope proteins defined by amino acids 1-191, 192-383 and 384-980 of sequence AAR53921 are claimed. The proteins have mol.wt. 22, 35 and 70 kD, respectively, and are useful for preparing vaccines against HCV
                                                                                                                                                                                                                                 Protein constituting hepatitis C virus particles and its expression useful for preparation of vaccines.

      This sequence is encoded by a fragment of the hepatitis C virus (HCV) genome including the hypervariable region. The DNA region is amplified by the primer sequences given in AAT03664-73. The amplified product is subjected to electrophoresis under denaturing conditions. The primers may be used in combination with the primer sequences given in AAT03674-76. Preferably, primer MS1, MS2, MS3, MS4, MS5 or MS6 and an oligo selected from MR1, MR2 or MR1, are used as primer pairs

AAQB1559 encodes AAR68864 hepatitis C virus (HCV) RNA helicase. The DNA was used in the construction of an expression vector, which was used to transform a baculovirus host. The transformed baculovirus could then be used for the recombinant prodn. of HCV RNA helicase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 MSTNPKPORKTKRNTNRRPQDVKFPGGGQIVGGVYLLPRRGPRLGVRATRKTSERSQPRG

This sequence represents the N-terminal 97 amino acids of the hepatitis C virus (HCV) core protein. Peptide fragments derived from this sequence contained epitopic regions. These peptides may be used alone or as a part of a larger peptide, or in a mixture of peptides for the detection of HCV or in a vaccine for its prevention. See also ARR40979-99. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 27-AUG-2003 to correct OS
      The invention relates to the novel testing method for diagnosing liver cancer. The novel method comprises amplifying the amino terminal region of a hepatitis-C virus NS3 gene using a predatermined primer and determining the hepatitis-C virus in a base sequence of the obtained but fragment. The novel testing method is useful for diagnosing liver cancer and also used in a gene amplification technique, a clinical laboratory test reagent, a polymerase chain reaction, a base sequence analysis and genetic engineering. The method enables the detection of a hepatitis-C virus having high carcinogenicity with high specificity. This sequence impresents the protein of the hepatitis-C virus NS3 gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hepatitis C virus peptide(s) and antibodies - used for immunoassays for hepatitis C virus or protective vaccines.

New isolates J1 and J7 of HCV were isolated from Japanese blood donors who had been implicated as non-A, non-B hepatitis (NANBH) carriers, and the amino acid sequences of various viral domains of these isolates were determined (see AAM30583-87). The C/E region. Heterogeneity was detected between J7 C/E clones isolated from the same donor. The new HCV isolates have amino acid and

ö
nucleotide (see also AAX00400-04) sequences which are distinct from the HCV1 prototype. These differences can be exploited for use in diagnostics for NAMBH, recombinant protein production and vaccine development. Claimed HCV J1 and J2 polypeptide antigens can be used: (i) as immunoassay reagents, or standards, to detect HCV antibodies, e.g. for diagnosing infection or screening donated blood; (ii) to generate specific antibodies (used for detecting the corresponding polypeptide, to screen for antiviral agents, for virus isolation and for passive immunisation); (iii) in protective or therapeutic vaccines, and (iv) for isolation of non-A, non-B viruses
                                                                                                                                                                                                                                                                                                                                                                    9

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

Patent No. 5882852...
GENERAL INFORMATION:

APPLICANT: BUKH, J., MILLER, R.H. AND.
APPLICANT: BUKH, J., MILLER, R.H. AND.
TITLE OF INVENTION: NUCLEOTIDE AND DEDUCED
TITLE OF INVENTION: CORE GENES OF ISOLATES OF HEPATITIS C VIRUS
TITLE OF INVENTION: AND THE USE OF REACENTS DERIVED FROM THESE
TITLE OF INVENTION: SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES
NUMBER OF SEQUENCES: 25
CORRESPONDENCE ADDRESS:
